SUMMARY

A software engineer who is interested in software development field and seeking to leverage acquired academic knowledge and work experience to effectively fill a software engineer position. I'm a dedicated worker aiming to improve myself and help you to achieve company goals and take on responsibility as quickly as possible.

EXPERIENCE

Backend Developer (Laravel-CodeIgniter)

Meta Codex| Egypt, Cairo (remotely) | Jan 2022-present

- Conducting Project Analysis: Successfully performed project analysis, gaining a   comprehensive understanding of project objectives, scope, and technologies used

- Fixing Bugs: Resolved and fixed a wide range of software bugs, ensuring smoother project performance and enhanced user experience.

- Instructing Junior Programmers: Provided mentorship and guidance to junior programmers, assisting in their skill development, and contributing to team growth

- Developing Projects: Actively participated in project development, contributing to the creation of new features, and ensuring project success

 - Team Leader: Effectively collaborated with the team to gather project requirements, ensuring alignment with project goals and objectives

Backend Developer (Laravel-CodeIgniter)

AL Atheer-Tech| Egypt, Sheheen Elkem | Mar 2021- Jan 2022

-I focused on foundational tasks such as creating forms and assisting senior engineers with their requests. This role allowed me to learn and grow in a supportive environment.

- Helping the Team to Develop Projects: As my experience and skills grew, I transitioned to more challenging roles. I began actively contributing to project development, collaborating with the team to create and enhance software solutions.

-Code Review: Participate in code reviews, offering and receiving feedback on code quality, best practices, and adherence to coding standards

PROJECTS

جمعية ابناء لرعاية الايتام -السعودية(CodeIgniter)

"An NGO for the care and sponsorship of orphans by providing financial and in-kind assistance to orphans and their families. The association's management system includes:

Human Resources Management: This involves registering all employee data and overseeing the administrative processes related to their essential functions within the association. It covers employee requests for leave, permissions, advances, as well as attendance, departure, and absences, with a link to their financial data for salary processing.

Financial Affairs Management: This includes recording all receipts and disbursements, such as assistance and sponsorship payments, employee salaries, and conducting financial accounting procedures, as well as preparing budgets.

Family Management: All data related to orphans and their families are recorded, and files are created to ensure their sponsorship until they reach adulthood.

Sponsorship Management: All data related to orphan sponsors and the assistance provided to orphans are recorded."

Website:أبناء

Homelet: Real-estate (Laravel-Api)

The Residential Units Platform is a website designed to showcase residential units, provide detailed information about them, and display their sale or rental prices. It offers an easy-to-use search feature, allowing users to find the desired residential unit by specifying the city, unit type, status, area, and price range.

The system for residential units allows unit owners to have their own control panel for inputting their respective units and presenting them on the website. Unit details are reviewed by the site's administrator for approval before being displayed on the site.

For administrators, the control panel enables the input of all unit settings, including data uploads, and allows tracking of all inquiries submitted through the website.

The platform and control panel support two languages: Arabic and English. The system comprises a public-facing website, an administrator control panel, and an owner's control panel.

Free Fare : Transportation-app(Laravel-api)

This is a non-profit service project designed to benefit car owners. It enables them to participate in 'Kilo Share,' meaning that if two individuals are headed to the same destination and their journey starts from the same location, rather than each person using their own car, they can share a single vehicle. This way, one person can share the ride with the other, effectively splitting the distance or 'kilo share' for the trip.

This project is a mobile application, and registration is required for car owners only. Each user registers their trips, specifying the days and times. Other users can search for trips heading to a particular location and request to join a shared ride with the trip owner. The primary mode of exchange between users is 'Kilo Share,' replacing traditional monetary transactions.

E-Commerce (CodeIgniter)

This is an e-commerce website where products are listed, and users can browse these products, add them to their cart, and proceed with online payments. There is an admin control panel dedicated to the administrator for configuring store settings and products. It allows uploading data related to stores, merchants, and linking their products. Each merchant can monitor their products through a dedicated control panel, where they can upload store and product information and track their sales.

The website is multilingual, supporting both Arabic and English. It includes features for online payment, product browsing, and saving items in a cart until the checkout process is completed.
